

Amendments to the Specification

Please amend the paragraph found at page 6, lines 14-19 of the specification as follows:

Application Lifecycle Management refers to the characteristics and features of the Application Model that relate to managing the installed state of an application throughout its lifecycle. To begin, the application 210 can either be run from the server ~~[[sever]]~~ (as an "Express Application"), or locally (as a "Managed Application"). In most cases, these choices don't require any code changes. They simply require changing an attribute in the application manifest 211.
